4½ x 6 ¼

#6 Wanda Shelp Trifold, hardanger—3¾ x 8½

#7 Mary Elizabeth Laughlin Trifold, opphämpta
4½ x 6¼

#8 Eleanor Best Trifold, accordion purchased—4¾ x 7

Greeting Cards

Woven inserts in greeting cards send one of the most personal touches for any type of message that can be found. It shows that you care enough to spend some time preparing a card. The cards with weaving attached can be used as a small gift. The personal gain the weaver gets by having to

create a design can be reward in itself, but to design a piece of fabric and incorporate it in a pleasing card is an achievement that even a beginning weaver can do. Several considerations must be made before beginning to plan the card. The first one should be the size of the envelope that is available unless you plan to make one of your own. Standard sizes of envelopes ¹

that can be purchased in quantity vary from fairly small ones to quite large ones. The post-office will not accept below a certain size. Oversize envelopes will require more postage.

The size and shape of a card may be controlled by the

tally for a bifold card. It can be

be folded lengthwise and then along the width for a quad fold card. The bifold card needs a little over 8½ x 5¼ as there should be enough room to fit the card in the envelope without distorting it. The quadfold 4¼ x 5½ so

may satisfy your needs. Cards made for photographic inserts are another way to show off weaving inserts.

The third way to make cards for weaving is to use a trifold. The trifold can be used to hide the edges of the weaving. In essence the card then usually becomes a bifold when finished.

A word about making the cuts for your weav-

ing insert. An X-acto knife is the best way to cut out the "hole" for your weaving. There are special shape cutters in ovals, circles and other designs which can be used if a quantity or precision work is required, but special edges around curving or box designs need to be neat for a professional look.

Barbara Walker has made her own cards for years. They are originals in design and weaving. She usually tries to make an analogy to the life she is living, such as the open doors to her new home when she returned from Germany. Her new address number and sparkling wreaths show a warm welcome to visitors.

Her cards are made from 8½ x 11 sheets of paper folded either lengthwise or crosswise and again folded in half. All the cards are numbered and signed on the back, i.e. 6/100.

The most accessible size of paper is 8½ x 11 or 11 x 8½. It can be folded in many ways to accommodate the size of the woven insert.

Choice of paper is important. A very light weight paper will not support a fabric that is bulky, so choose a paper

that is heavy enough to be a good “backing” for the sample. A maximum weight is card stock if you are planning to have a bi-fold or a trifold. A textured or parchment finish paper is usually good. When making the folds, make sure to score the fold line so it will fold evenly and not split. Use the dull side of a knife with a ruler to guide the scoring in a straight line. It may be necessary to mark the exact place that the scoring should take place.

The figures with the x's show

is put in place and then the flap the middle surface. A choice of or outwards will have to be made The greeting areas are shown by

that will be in place when the card is folded and completed. The single line on the vertical and horizontal quadfold cards can show the designer's name. If the cards are to be made smaller or larger, these diagrams will aid in the placement of the printing and the sample. Further embellishments may be made if desired.

the placement of the woven sample on the back side of the front flap. In the case of the bifold examples, a covering for the sample will have to be made to hide the edges which may easily fray. In the trifold examples, the sample is folded over and glued to having the card fold inwards prior to printing the greeting.

Hint: If the cards are prepared on the computer, mark fold lines in a 10% tint to show where the folds are to be made.
